No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score

Perfect score:
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                         Score

Claim 8; Page 16; 18pp;

German.

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing a least one motif His-Pro-X where x = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-x where x = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion protein as (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP).                                                                                                                                                                                                                                                      This invention describes novel polypeptides (I) that are muteins of bilin -binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind
                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Prox where x = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion protein as (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention

CC comprising any of the amino acid sequences cited above; a method for antibody that immunospecifically binds to the target polypeptide, where the target polypeptide comprises any of the above-mentioned amino acid sequence that is at least 95% identical to the sequences, an amino acid sequence that is at least 95% identical to the above-mentioned amino acid sequence of at least one domain of the above-mentioned amino acid sequences, or an amino acid sequence that is at least 95% identical to the domain of the above amino acid sequence of a treatment of a pathology, where the pathology is related to aberrant capression or aberrant physiological interactions of a target polypeptide and a method of screening for a modulator of acid to apathology where the pathology is related to aberrant capression or aberrant physiological interactions of a target polypeptide or predisposition to a pathology associated with a target polypeptide. The modulating compounds have anorectic and antidiabetic activities. The mucleic acid sequences of the invention may be used in gene therapy to treat disorders. The proteins of the invention may be used in creating a vaccine. The composition and methods are useful for identifying compounds that modulate protein activity or for diagnosing, preventing or treating compounds to the treating compounds are also used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and of the invention and beauty protein activity or proventive medicine, and compounds in the modulation of the sequence represents a NOVX polypeptide of the invention and probes, in the modulation of the sequence represents a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20-DEC-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel isolated nucleic acid molecule comprising any of the nucleotide sequences (e.g. 3614, 2127 or 2120 base pairs) fully defined in the specification; or encodes any of the amino acid sequences (e.g. 698, 702 or 709 amino acids) fully defined in the specification. The invention further comprises: an isolated polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anorectic; antidiabetic; gene therapy; vaccine; obesity; diabetes; insulin resistance; hybridization probe; chromosome mapping; tissue typing; preventive medicine; pharmacogenomics; NOVX; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 3; SEQ ID NO 32; 570pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New NOVX nucleic acid molecules and polypeptides useful for preventing treating NOVX-associated disorders, e.g. diabetes, insulin resistance cobesity, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB; ADP87576.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Berghs C,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27-OCT-2003; 2003WO-US034114.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-JUL-2004.

                                                         disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the human aggrecanase ADAMTS4 mutant E362Q protein with

This invention describes the preparation of anticalins from polypeptides of the lipocalin family by mutation of amino acids in the region of the 4 peptide loops (at one end of the cylindrical 'leaflet' structure'). Anticalins can bind to a predetermined ligand with determinable affinity. Anticalins or fusions of anticalins, are used: (a) when immobilized, for separation; and (b) when labeled, for identification of ligands (or their fusions or conjugates). Typically they bind to tissue- or tumor specific surface molecules and can be used for tumour analy or directly for tumour therapy. Mutations can be introduced into lipocalin polypeptides more easily than into antibodies, since lipocalin polypeptides have only 4 (contrast 6) sequence segments. The peptide loops can tolerate amino
                                                                                                                                                                                      New anticalins produced by mutation of lipocalin family protein
                                                                                                                                                                                                                               WPI; 1999-255093/21.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                  This invention describes novel polypeptides (1) that are muteins of bilin binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (1), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecules, other biological or synthetic macromolecules or low
                                                                                                                                                                                                                                                                                                                                                                                       New muteins of bilin-binding protein, useful for detecting digoxigenin being used as label in e.g. binding assays, are very selective for digoxigenin;
                                                                                                        Sequence 396 AA;
                                                                                                                                                molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (1) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners to a trached to either end without compromising their ability to bind be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                                                                                                                                                           Example 1; Page 55-56; 80pp; German.

                                                                                                                                                                                                                                                                                              This invention describes novel polypeptides (I) that are muteins of bilin binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAB46423 standard;

                                                                                                                                                                                                                                The present invention relates to a method for generating muteins of human neutrophil gilatinase-associated lipocalin (NGAL), rat alpha2-microglobulih-related protein (A2m) or mouse 2493/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein pIII of a filamentous bacteriophage of the M13-family of a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid pHNGAL5, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and a fragment of phage coat protein pIII.
                                                                                                                                                                                                                                                                                                                                                                                                               Generating a mutein of a protein for validating the protein as drug target by subjecting the protein to mutagenesis at sequence positions corresponding to sequence positions of the human neutrophil gelatinase-associated lipocalin.

                                                                                                                                                                                                                                             The present invention relates to a method for generating muteins of human neutrophil gelatinase-associated lipocalin (hNQAL), rat alpha2-microglobulin-related protein (A2m) or mouse 2493/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein pIII of a filamentous bacteriophage of the M13-family or for a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid pHNGAL3, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and a

The present invention describes a method for generating a mutein of a CC protein selected from a human neutrophil gelatinase-associated lipocalin CC (hNGAL), rat alpha2-microglobulin-related protein (A2m) and a mouse CC 2493/uterocalin (24p3), where the mutein has a detectable affinity to a given target, comprising subjecting the protein to mutagenesis at CC positions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in CC muteins of the protein. Also described: (1) a mutein of hNGAL, alm or 24p3 having detectable binding affinity to a given target, obtained by CC the method described above; (2) a fusion protein comprising the mutein of hNGAL, A2m or 24p3, where an enzyme, a protein or a protein domain, a CC peptide, a signal sequence and/or an affinity tag is operably fused to the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, A2m or 24p3 or the fusion protein of exercised above, and a carrier. The muteins have cytostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 24p3 or a fusion protein. The mutein of hNGAL, A2m or 24p3 or a fusion protein. The mutein of hNGAL, A2m or 24p3 or the fusion protein is useful in detecting a given target by contacting the mutein of the given target under conditions that allow complex formation between the mutein and the given target, and determining the complexed mutein a portion a mutein of the activity and can be actived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 3; Page 94-95; 122pp; English.

The mutein may also be used in medicine, e.g. for tumour imaging or directly for cancer therapy. The present sequence represents a modified hNGAL, Strep-tag II and phage coat protein pIII fragment fusion protein given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 400 AA;
                               Generating a mutein of a protein, e.g. human neutrophil gelatinase-associated lipocalin, rat alpha2-microglobulin-related protein or m 24p3/uterocalin, comprises subjecting the protein to mutagenesis.
                                                                                                                                                                                                                                                                            Region

CC given target, comprising subjecting the protein to mutagenesis at C positions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in muteins of the protein. Also described: (1) a mutein of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by the method described above; (2) a fusion protein comprising the mutein of chNGAL, A2m or 2493, where an enzyme, a protein or a protein domain, a CC peptide, a signal sequence and/or an affinity tag is operably fused to the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the fusion protein described above, and a carrier. The muteinsh have cytostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or the fusion protein is useful in generating or producing a mutein of conditions that allow complex formation between the mutein and the given target under conditions that allow complex formation between the mutein and the given carget, and determining the complexed mutein by a suitable signal. The conjectile, an organic molecule or a metal complex and the detection is carried out for validation of the protein as a pharmacological drug carget. The mutein may also be used in medicine, e.g. for tumour imaging cor directly for cancer therapy. The present sequence represents a cc modified hNGAL, Strep-tag II and phage coat protein pIII fragment fusion correction of the present sequence represents as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 14

Human aggrecanase modified ADAMTS4 (mTS4) protein - SEQ ID 49.

```
Ś
                                                                                                                                  Compositions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in the protein to mutagenesis at the protein. Also described: (1) a mutein of hNGAL, resulting in CC muteins of the protein. Also described: (1) a mutein of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by CC hNGAL, A2m or 2493, where an enzyme, a protein or a protein domain, a CC peptide, a signal sequence and/or an affinity tog is operably fused to CC the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the fusion protein described above, CC and a carrier. The muteins have cytostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or the fusion protein a suspected of containing the given target under conditions that allow complex formation between the mutein and the given target and determining the complexed mutein by a suitable signal. The CC given target is a protein or protein domain, a peptide, a nucleic acid conditions that allow complex domain, a peptide, a nucleic acid cor directly for cancer therapy. The present sequence represents a cc modified hNGAL, Strep-tag II and phage coat protein pIII fragment fusion cor condition in the exemplification of the present invention.

                                                                                                                                                                                                                     The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metalloprocease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAWTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAWTS4 protein by at least one amino acid. ADAWTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of a human aggrecanase modified ADAMTS4 (mTS4) protein of the

APPLICANT: Lohning, Corinna
TITLE OF INVENTION: No. US20020034733Alel methods for displaying (poly) peptides/prote
TITLE OF INVENTION: particles via disulfide bonds
FILE REFERENCE: MORPHO/11
CURRENT APPLICATION NUMBER: US/09/809,517A
CURRENT FILING DATE: 2001-03-15
PRIOR APPLICATION NUMBER: EP 99114072.4
PRIOR FILING DATE: 1999-07-20
PRIOR APPLICATION NUMBER: EP 00103551.8
PRIOR APPLICATION NUMBER: EP 00103551.8
PRIOR FILING DATE: 2000-02-18
NUMBER OF SEQ ID NOS: 41
SOFTWARE: Patentin version 3.0
SEQ ID NO 33
LENGTH: 22
TYPE: PRT
ORGANISM: artificial sequence
FEATURE:
FORTURE:
OTHER INFORMATION: Description of Artificial Sequence: synthetic module

Sequence 30, Application US/09809517A

Patent No. 6753136

GENERAL INFORMATION:
APPLICANT: Lohning, Corinna
ITILE OF INVENTION: No. 6753136el methods for displaying (poly)peptides/proteins on b
ITILE OF INVENTION: particles via disulfide bonds
ITILE OF INVENTION: particles via disulfide bonds
ITILE REFERENCE: MORPHO/11
CURRENT APPLICATION NUMBER: US/09/809,517A
CURRENT FILING DATE: 2001-03-15
PRIOR APPLICATION NUMBER: EP 99114072.4
PRIOR FILING DATE: 1999-07-20
PRIOR APPLICATION NUMBER: EP 00103551.8
PRIOR FILING DATE: 2000-02-18
NUMBER OF SEQ ID NOS: 41
SOFTWARE: Patentin version 3.0
SEQ ID NO 30
LENGTH: 21
TYPE: PRT
Sequence 33, Application US/09809517A
Patent No. 6753136
GENERAL INFORMATION:
APPLICANT: Lohning, Corinna
ITITLE OF INVENTION: No. 6753136el methods for di
ITITLE OF INVENTION: particles via disulfide bor
FILE REFERENCE: MORPHO/11
CURRENT FILING DATE: 2001-03-15
PRIOR APPLICATION NUMBER: EP 99114072.4
PRIOR APPLICATION NUMBER: EP 99114072.4
PRIOR APPLICATION NUMBER: EP 00103551.8
PRIOR FILING DATE: 1999-07-20
PRIOR PILING DATE: 2000-02-18
NUMBER OF SEQ ID NOS: 41
                                                                                                                                                                                                                                                                                                                                                RESULT 2
US-09-809-517A-33
